HR Analytics and Employee Data Analysis

📌 Objective

The objective of this project is to design and analyze an employee database using SQL. The project focuses on understanding workforce distribution, salary patterns, and department-wise insights to support better decision-making in an organization.

📌 Tools & Technologies

- SQL (Structured Query Language)
- Relational Database Management System

📌 Database Structure

The project consists of three main tables:

1. Employees

Stores employee details such as employee ID, name, department, and city.

2. Departments

Contains department information including department ID and department name.

3. Salaries

Stores salary details of employees linked through employee ID.

📌 Key Features

- Creation of relational database with multiple tables
- Data insertion and management using SQL
- Use of JOIN operations to combine data from multiple tables
- Application of GROUP BY and aggregation functions
- Analysis of employee and salary data

📊 Analysis Performed

- Retrieved employee details along with department information
- Analyzed employee salaries using JOIN operations
- Calculated average salary for each department
- Identified highest paid employee in the organization
- Counted number of employees in each department

📈 Key Insights

- Identified departments with higher average salaries
- Observed salary distribution across employees
- Recognized top-paid employees
- Analyzed workforce distribution across departments

🎯 Conclusion

This project demonstrates the ability to design a relational database and perform HR analytics using SQL. It highlights practical skills in data analysis, query writing, and extracting meaningful insights from employee data.
